

Washim Ahmad

Freelance Automation & Python Engineer | Web Scraping Specialist

Email: washim0988@gmail.com • GitHub: github.com/washim0988-art •

Location: Kolkata, India

Profile

Self-taught automation engineer with hands-on experience building production Python pipelines: web scrapers (requests/BeautifulSoup/playwright, anti-bot handling), video rendering automation (FFmpeg GPU encoding), AI/LLM integrations, and multi-agent revenue systems. Comfortable working independently end-to-end: research, implement, test, deploy.

Core Skills

- Python: requests, BeautifulSoup, playwright, selenium, asyncio, concurrent.futures
- Web Scraping & Data: HTML parsing, API reverse-engineering, JSON/CSV pipelines, pagination, rate-limit & anti-bot handling
- Automation: cron scheduling, process supervision, background workers, REST APIs
- Media: FFmpeg (GPU NVENC), audio/video pipelines, caption generation, faster-whisper, edge-tts
- AI/LLM: OpenAI-compatible API integration, prompt engineering, zero-shot voice cloning (OmniVoice)
- DevOps: git, GitHub Pages, bash/PowerShell scripting, Windows/Linux, HTTP servers

Selected Projects

Web Scraping & Data Pipeline — Pexels/Pixabay Media Fetcher

Built an automated media acquisition pipeline consuming Pexels & Pixabay REST APIs (keyless, rate-limited): search, filter by orientation/resolution, download, and organize 36+ stock clips into a typed content catalog. Handled API quotas (200 req/hr), retries, and cache-by-24h policy.

AI Video Factory (Python + FFmpeg)

Engineered a scene-aware short-video renderer: neural TTS narration (Edge), word-timestamp transcription (faster-whisper), animated ASS karaoke captions, cinematic portrait crops, color grading, and GPU (NVENC) encoding — producing 8 videos under 30MB each with verified quality (caption burn + color fingerprint QA).

Autonomous Revenue Monitor (multi-agent system)

Designed an orchestrated set of daemon agents (bounty monitor, wallet poller, status worker, services hunter) with auto-restart supervision, ROI-based reallocation, and a live status dashboard. Includes zero-account job-feed aggregation (RemoteOK API, WeWorkRemotely RSS) with skill-matching scoring.

Static Storefront Deployment (GitHub Pages)

Full lifecycle of a static sales page: responsive HTML/CSS, lazy-loaded media, poster frames, performance optimization (180MB→28MB page weight), custom-domain readiness (CNAME + DNS), and branch-based CI-free deployment (gh-pages sync).

Why Me for This Role

I work with scraping daily: API-fetch automation, HTML parsing, rate-limit handling, and data cleaning. I'm methodical (verification scripts for every output), independent (built and shipped full systems solo), and fluent in English. I can start immediately on project-based tasks and follow complex guidelines precisely.
